PHISHING EMAIL ANALYSIS

BY David Ayelabola

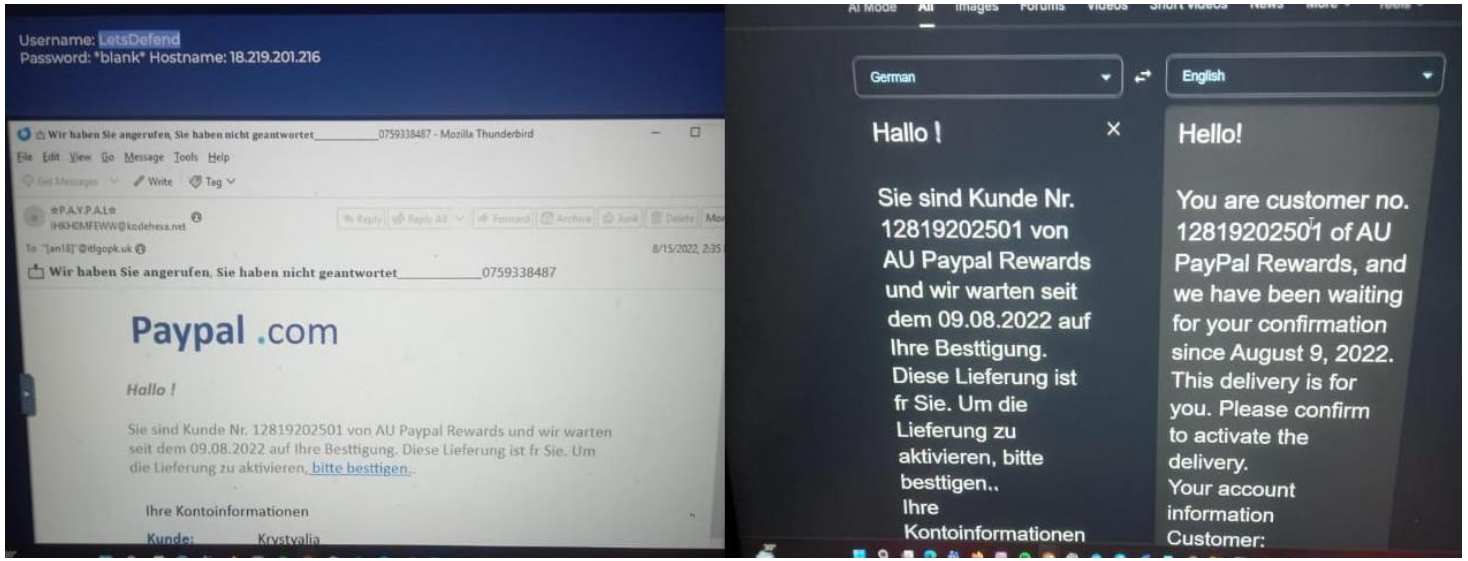

OBJECTIVES & Tools

- To analyze a phishing email
- To answer questions in the lab

- VirusTotal

STEP 1:

- I started the lab and clicked on files and I saw a zip file, I had to extract it, after extracting it, it showed me a phishing email file.
- I entered the email to analyze it and I found out it was a German email
- So I had to use google translate to be able to translate the words to English so as to understand the email.

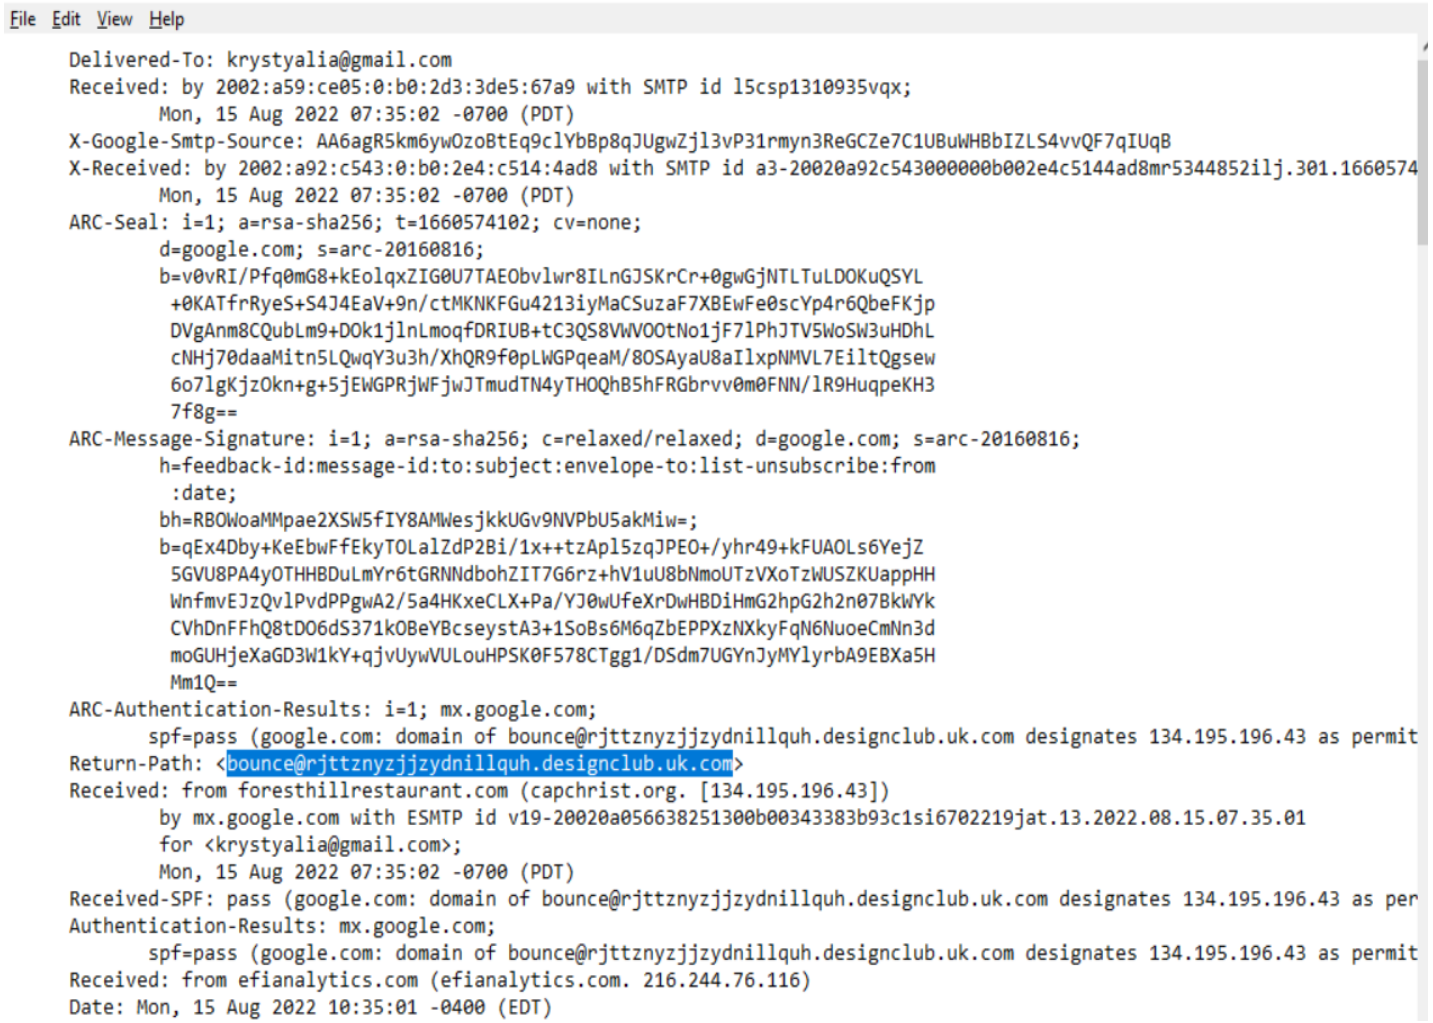

Step 2:

This is when I started answering the questions and carrying out the task

- The first question was" what is the return path of the email?"

To answer that I went to the "More" options and I clicked on "view source" then it showed me the source code of the email, then I traced out the return part of the email so I got this: "bounce@rjttznyzjjzydnillquh.designclub.uk.com"

Step3:

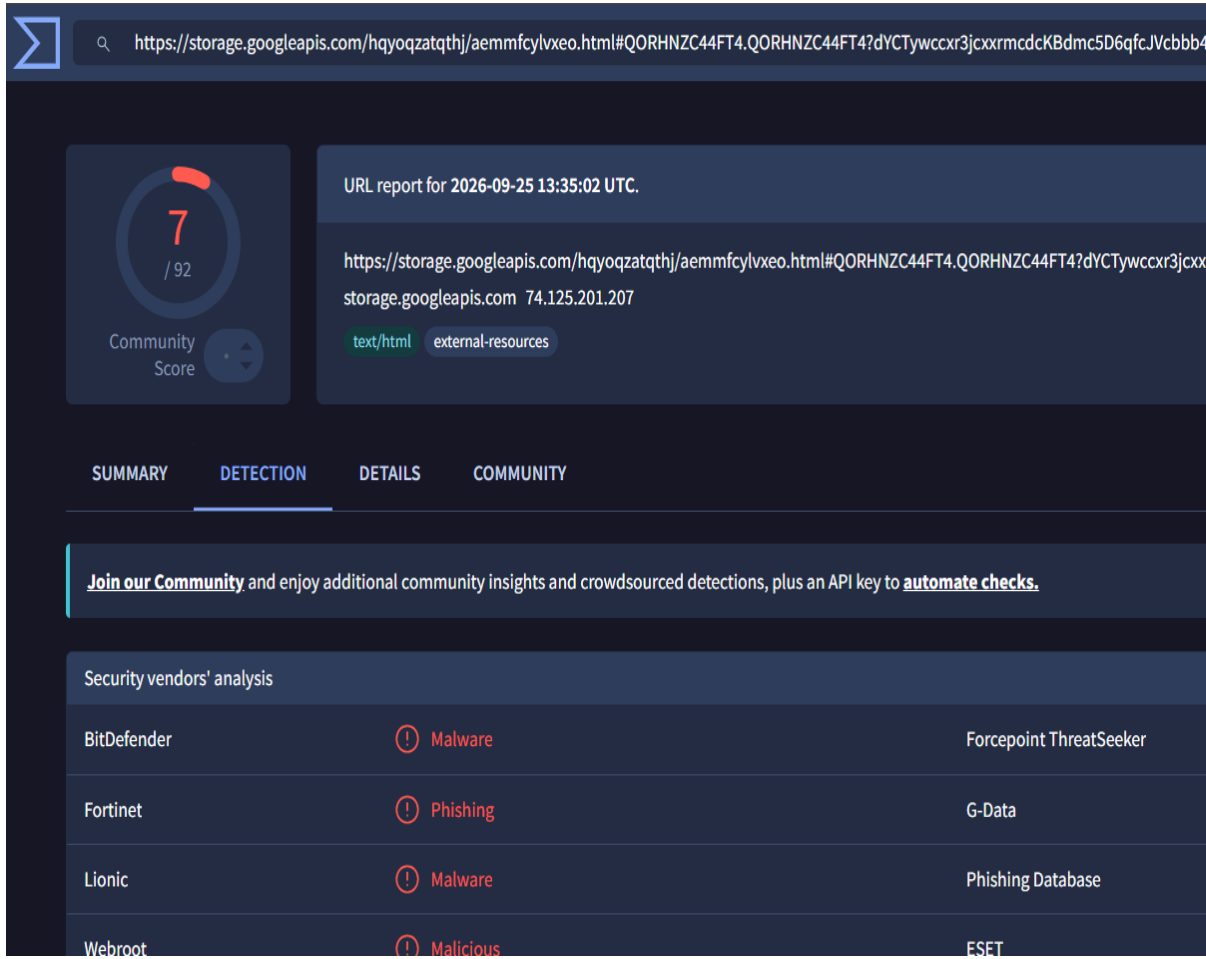

This is when I attempted the next question which is:

- What is the domain name of the URL in this email?

Answer : in the mail Answer : in the mail there's an URL link attached to it so I checked to know if its malicious by using Virustotal

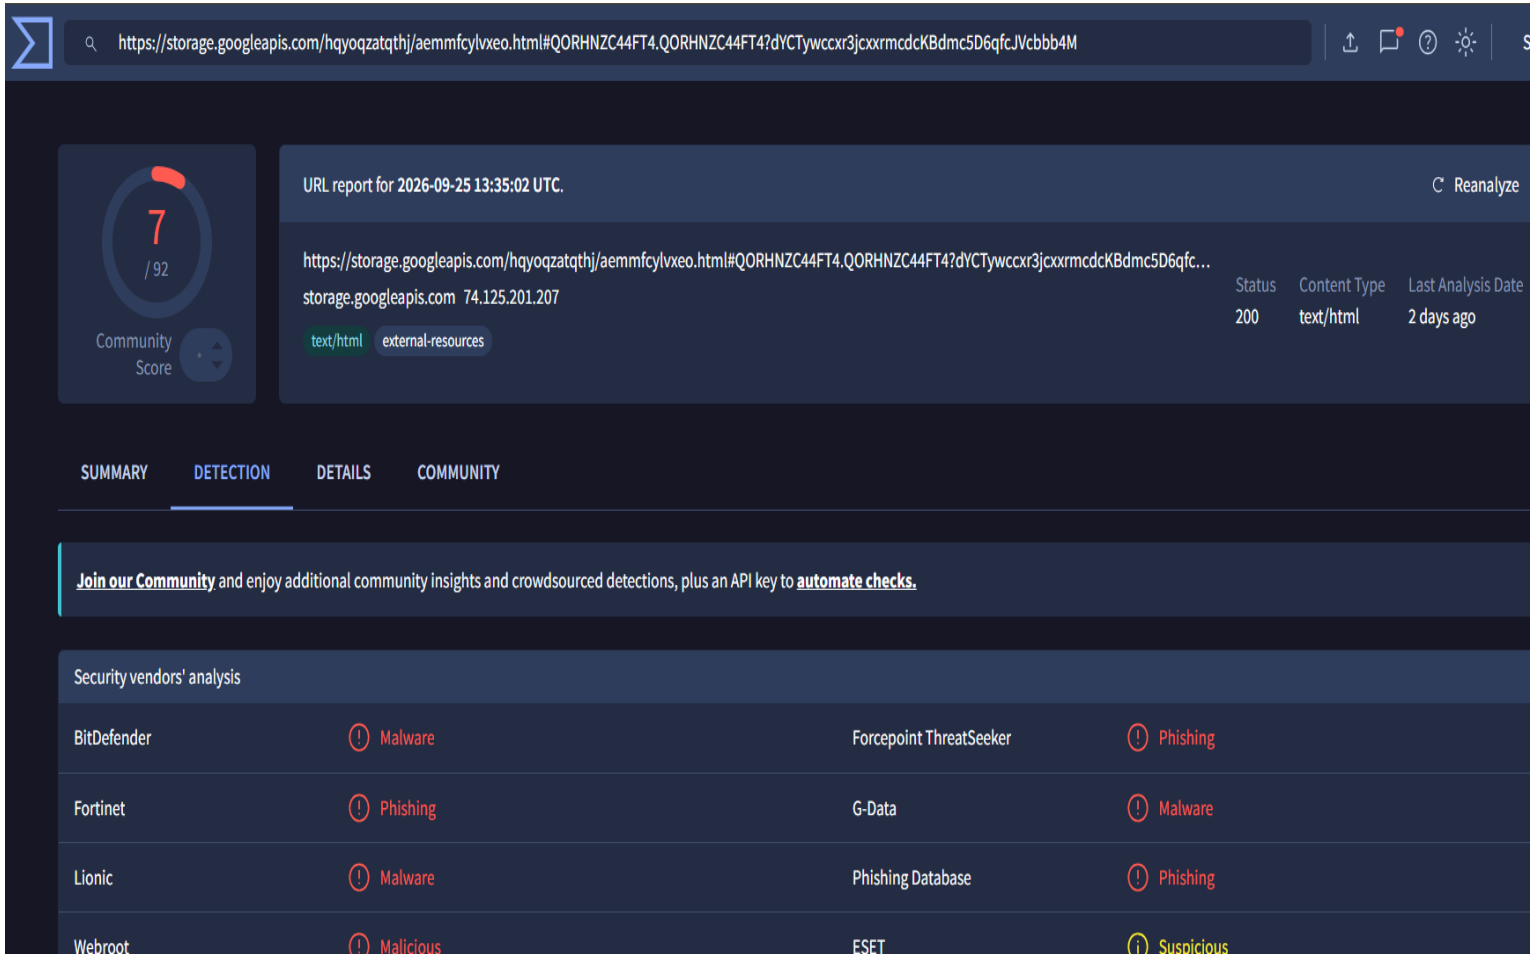

While using that it shows the domain name of the URL in this email.

Which is " storage.googleapis.com"

Step 4:

The next step I was asked to check if the domain mentioned in the previous question is suspicious, and with the help of virustotal I was able to detect that it is suspicious

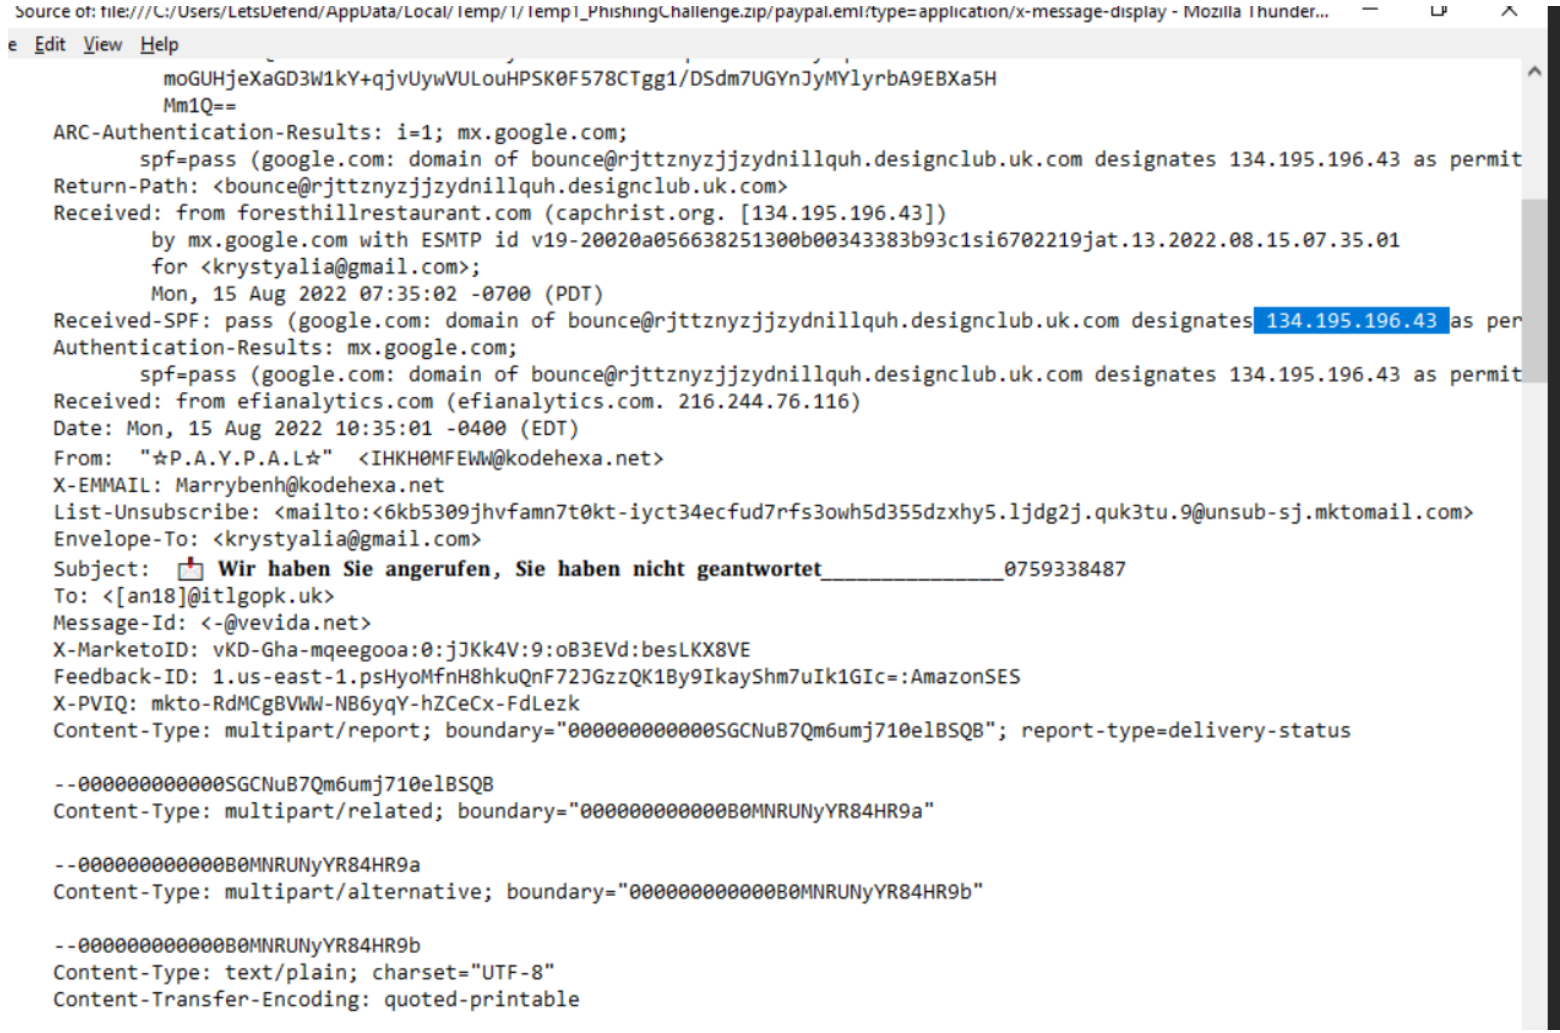

Step 5

In this step I was asked to check the IP address of the sender list in the Received-SPF header

So we went back to the mail in the lab and directly to the mails source code, where we spotted the IP address of the sender in the Received-SPF header

Which is : 134.195.196.43

- The last last question is " Is this a phishing email? "
- Answer : Yes its obviously a phishing email

CONCLUSION

How ever this is a presentation on a phishing mail, how to respond to it and analyze it

- You inspect the sender
- Hover before clicking
- Enable MFA
- Go direct: Never use links inside emails for sensitive logins; instead, type official website addresses or use saved bookmarks
- Then also regularly update your system

Thank you.
